                         W18842-70 are peptide fragments of the 65 kD human glutamic acid decarboxylase (GAD). The fragments are autoreactive substances used for decarboxylase (GAD). The fragments are autoreactive substances used for disposit of insulin dependent diabetes mellitus (IDDM). The diagnosis is determined by using a claimed method for diagnosis of cell-mediated diseases, which is effected diseases or a predisposition to cell-mediated diseases, which is effected by administering an autoreactive substance intradermally and establishing the diagnosis on the basis of the occurrence or lack of a positive reaction at the site of administration. The method is used for diagnosis of autoimmune and tumour diseases, preferably T-cell-mediated diseases such as rheumatoid arthritis, multiple sclerosis and especially IDDM.
                                                                                                                                                                                                                                                                                            Donie F,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                R76642-62 are derived from human glutamic acid decarboxylase and specifically react with T-cell sub-populations isolated from recently diagnosed Type-I diabetics. Pharmaceutical compsns. conty. these peptides and those shown in R88668-72, are useful for the diagnosis of a disease or predispositions of immune system disease, tumours, and autoimmune diseases, including diabetes. The peptides are able to detect specific T-cell subpopulations that are then used for antigen prodn.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim

                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a fragment of the glutamic acid decarboxylase 65 (GAD65) protein. The invention relates to a method of ameliorating GAD associated autoimmune disorders by administering a GAD65 peptide to the patient. The method can be used for ameliorating GAD associated autoimmune disorders such as IDDM (insulin dependent diabetes mellitus) and Stiff man disease. GAD65 can also be useful for screening drugs that alter GAD function, for generating monoclonal antibodies and in immunoassays. GAD65 is an effective diagnostic tool for predicting IDDM and the diagnosis is quite easy. It is also possible to obtain much larger quantities of polypeptide via recombinant techniques than are available from natural sources.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GAD65; glutamic acid decarboxylase 65; autoimmune disorder; IDDM; insulin dependent diabetes mellitus; Stiff man disease; diagnosis;

      R88668 is derived from residues 306-325 of human glutamic acid decarboxylase and specifically reacts with a T-cell sub-population isolated from recently diagnosed Type-I diabetics. Pharmaceutical compsns. contg. this peptide and those shown in R88667 and R76642-62, are useful for the diagnosis of a disease or predispositions of immune system diseases, tumours, and autoimmune diseases, including diabetes. The peptides are able to detect specific T-cell subpopulations that are then used for antigen prodn., e.g. by reinjection.
                                                                                                                                                                                                                                                                    Albert W,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a fragment of the glutamic acid decarboxylase 65 (GAD65) protein. The invention relates to a method of ameliorating GAD associated autoimmune disorders by administering a GAD65 peptide to the patient. The method can be used for ameliorating GAD associated autoimmune disorders such as IDDM (insulin dependent diabetes mellitus) and Stiff man disease. GAD65 can also be useful for screening drugs that alter GAD function, for generating monoclonal antibodies and in immunoassays. GAD65 is an effective diagnostic tool for predicting IDDM and the diagnosis is quite easy. It is also possible to obtain much larger quantities of polypeptide via recombinant techniques than are
                                                                                                                                                                          Antigen-specific activated T-lymphocytes and their detection interaction with inventive peptide(s) of peptide-MHC complex useful in diagnosis of e.g. diabetes and auto:immune disease
                                                                                                                                                                                                                                                                                                               (ENDL/)

                                                                                        W18842-70 are peptide fragments of the 65 kD human glutamic acid decarboxylase (GAD). The fragments are autoreactive substances used for decarboxylase (GAD). The fragments are autoreactive substances used for diagnosis of insulin-dependent diabetes mellitus (IDDM). The diagnosis is determined by using a claimed method for diagnosis of cell-mediated diseases, which is effected diseases or a predisposition to cell-mediated diseases, which is effected by administering an autoreactive substance intradermally and establishing the diagnosis on the basis of the occurrence or lack of a positive reaction at the site of administration. The method is used for diagnosis of autoimmune and tumour diseases, preferably T-cell-mediated diseases such as rheumatoid arthritis, multiple sclerosis and especially IDDM.

                                                                                                                                                                                                                                                                                   The sequences given in R47505-09 represent epitopic fragments of the protein encoded by the tumour suppressor gene DCc. These peptides are reactive with the monoclonal antibody (MAb) of the invention, pref. the mouse MAb KM890, belonging to the IgG3 subclass. This MAb may be used in immunohistochemical staining for quantitative determination of DCC gene proucts, as well as for cancer diagnosis, eg. by histological tissue examination and imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      R47505;

R76642-62 are derived from human glutamic acid decarboxylase and specifically react with T-cell sub-populations isolated from recently diagnosed Type-I diabetics. Pharmaceutical compsns. contg. these peptides and those shown in R77571-72, are useful for the diagnosis of a disease or predispositions of immune system diseases, tunours, and autoimmune diseases, including diabetes. The peptides are able to detect specific T-cell subpopulations that are then used for antigen prodn.,
                                                                                                                                                                                                                                                                                                         insulin-dependent diabetes mellitus; IDDM; cell-mediated predisposition; autoimmune; tumour; rheumatoid arthritismultiple sclerosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               w18842-70 are peptide fragments of the 65 kD human glutamic acid decarboxylase (GAD). The fragments are autoreactive substances used for diagnosis of insulin-dependent diabetes mellitus (IDDM). The diagnosis is determined by using a claimed method for diagnosis of cell-mediated diseases or a predisposition to cell-mediated diseases, which is effected by administering an autoreactive substance intradermally and establishing the diagnosis on the basis of the occurrence or lack of a positive reaction at the site of administration. The method is used for diagnosis of autoimmune and tumour diseases, preferably T-cell-mediated diseases such as rheumatoid arthritis, multiple sclerosis and especially IDDM.

Recombinantly produced NDF bearing this N-terminal sequence was found to stimulate tyrosine phosphorylation of the neu receptor protein in an activity assay. NDF peptides have the ability to induce a differentiated phenotype in certain cell lines and can stimulate or inhibit proliferation of certain cell lines. The NDF's can be used to treat wounds, tumours derived from epithelial tissue of the breast, stomach etc., gastrointestinal disease, Barrett's cesophagus, (non-)cystic kidney disease or inflammatory bowel disease. The CDNA sequences encoding these protein sequences were used in the isolation of related sequences from human CDNA libraries which encode human NDF's.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               differentiation factor (NDF), NDF-betal(177-246). Recombinantly produced NDF bearing this N-terminal sequence was found to stimulate tyrosine phosphorylation of the new receptor protein in an activity assay. NDF peptides have the ability to induce a differentiated phenotype in certain cell lines and can stimulate or inhibit proliferation of certain cell lines. The NDF's can be used to treat wounds, tumours derived from epithelial tissue of the breast, stomach etc., gastrointestinal disease, Barrett's oesophagus, (non-)cystic kidney disease or inflammatory bowel disease. The cDNA sequences encoding these protein sequences were used in the isolation of related sequences from human cDNA libraries which encode human NDF's.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant neu differentiation factors and correspare used in the treatment of tumours, dermal wounds, and gastrointestinal, kidney and inflammatory bowel diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hu S,

W884045-49 represent the peptide fragments obtained after trypsin digest of the protein gp30. Gp30 is a 30 kDa growth factor that induces phosphorylation of erbB-2 protein p185 in cells that overexpress erbB-2, induces internalisation of the erbB-2 receptor, stimulates growth of erbB-2-overexpressing cells at low concentrations, inhibits growth of erbB-2-overexpressing cells at high concentrations, reverses
                                                                                                                                                                               (LIPP/)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polypeptides were purified from media conditioned by the oestrogen receptor negative human breast cancer cell line MDA-MB-231 and the Sk-Br-3 breast cancer cell line. The polypeptides were partially digested with trypsin and the tryptic peptides were separated by HPLC on a C18-reversed phase column. Single peaks were subjected to protein sequence analysis; five independent fragments were sequenced. The present sequence was obtained from peak 5.
                                                                                                                                                                                                                                                                     26-JUL-1993;

inhibiting the 5-

(epidermal growth factor

receptor),

where the

cells are

This sequence represents a fragment of the gp30 protein (I) that binds to clone gp30/alphal. The invention relates to a protein (I) that binds to heparin-Sepharose, has a molecular weight of 30 kDa (22 kDa after N-glycanase digestion), an amino acid sequence of a 22 kDa peptide produced by in vitro translation of poly-A RNA from MDA-MB-231 cells, and produces the same pattern as the translation product of the MDA-MB-231 cells upon hydrolysis with Staphylococcus aureus VB protease or elastase. (I) is useful for stimulating the growth of normal cells an inhibiting the growth of cells which overexpress the oncogene exbB-2 product of the growth of cells which overexpress the oncogene exbB-2 product of the growth of cells which overexpress the oncogene exbB-2 product of the growth of cells which overexpress the oncogene exbB-2 product of the growth of cells which overexpress the oncogene exbB-2 product of the growth of cells which overexpress the oncogene exbB-2 product of the growth of cells which overexpress the oncogene exbB-2 product of the growth of cells which overexpress the oncogene exbB-2 product of the growth of cells which overexpress the oncogene exbB-2 product of the growth of cells which overexpress the oncogene exbB-2 product of the growth of cells which overexpress the oncogene exbB-2 product of the growth of cells which overexpress the oncogene exbB-2 product of the growth of cells which overexpress the oncogene exbB-2 product of the growth of cells which overexpress the order of the growth of cells which overexpress the growth of cells which cells which overexpress the growth of cells which cells which overexpress the growth of cells which overexpress the growth of cells which cel

The specification describes an antibody that reacts specifically with the gp30 protein, but does not cross react TGF-alpha, EGF, amphiregulin or HB-EGF. The antibody can be used to detect the 30 kD erbB-2 ligand (gp30) in serum or urine samples as a prognostic/diagnostic marker for tumour progression.
                                                                                                                                 Novel growth factor ligand useful cell and inhibiting the growth of oncogene erbB-2 product .
                                                                                                                                                                                                                                                                                                                                                                                                       Adenocarcinoma; gp30; gp30/alpha1; heparin-Sepharose binding protein; oncogene erbB-2; EGFR; epidermal growth factor receptor; cancer; diagnostic marker; tumour progression; breast cancer; prostate cancer;

                                                                                                                                                                                                                   The wild-type NF is pref. NGF, BDNF, NT-3 or NT-4. In the 30-34 region, the modifications are pref. at Lys32 (or Arg32 in NT) and/or Lys34; in the 93-98 region, Lys95 is partic. replaced by Ala. Esp. for NT-3, Arg32, His34, Asn93 and/or Asn94; for BDNF, Lys95, Lys96 and/or Arg97, and for NT-4 Glu94 and Arg96 are replaced. The mutants differ from wild-type NF as regards receptor binding affinity and specificty, esp. they can bind to trk receptor but not to p75NGFR. Modifications in the 25-36 amino acid region improve stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               comparison of NGF genes from different species has revealed clusters of amino acid residues which are highly conserved across different gps. of vertebrates (rat, mouse, human, bovine, guinea pig and chicke NGF: R41747; xenopus NGF: R41748; snake NGF: R41749; rat BDNF: R41750; rat NT-3: R41751; and xenopus NT-4: R41752).

New mutant neurotrophic factor (NF) comprises a wild-type NF having, as modification, replacement of one or more positively charged amino acids, in the amino acids regions 30-34 or 93-98, with uncharged or negatively charged amino acids, so that the mutants have reduced ability to bind to p75NGFR (a transmembrane glycoprotein which binds NGF with low affinity), c.f. wild-type NF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New mutant forms of neurotrophic factor of increased stability have specific positively charged aminoacid(s) replaced, showing more selective binding but equiv. biological activity
                                                                                                                                                           Sequence

                                                                                                                                                                                                                                                                                                               Y30496-513 represent amino acid substitution variants of a major epitopic region 2 of the CD2 protein. The peptides were acquired by mutant selection. The CD2 protein and epitopes are used to demonstrate the method of the invention. The specification describes a rapid mutational analysis method for mapping protein epitopes and binding domains, by identifying substitution mutations that result in the loss of binding capacity. The method may be used for mapping protein epitopes, antigenic domains and binding sites. It has been used for mapping binding sites for sixteen anti-CD2 and anti-CD4 monoclonal antibodies. The method is especially useful for ligand binding site studies for the design of
                                                             R41613
                                                                                                                                                                                                                                                                          new ligands and drugs.
note: This sequence does not appear in the specification it was created using information provided.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         inhibiting thrombin-induced smooth muscle cell proliferation. They can be used for treating and preventing neurodegenerative disease, treating and preventing bone resorption (eg. in osteoporosis), treating and preventing thrombin-induced inflammation, eg. in adult respiratory distress syndrome, septic shock, septicemia and reperfusion damage) and for inhibiting platelet-dependant thrombosis fusion proteins containing these sequences may also act as thrombin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences given in R41583-633 are thrombin receptor inhibitor peptides (TRIPs). TRIPS competitively bind to and inhibit the thrombin receptor without afecting thrombins activities toward fibrinogen and other proteins involved in coagulation. They can be used for inhibiting thrombin induced platelet activation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Erabutoxin; thrombin; receptor; inhibitor; peptide; TRIP; septicemia; fusion protein; plasmid; PIII; phagemid vector; pTZ19R; syngene; fibrinogen; coagulation; platelet activation; reperfusion damage; neurodegenerative disease; bone resorption; osteoporosis; thrombosis; inflammation; adult respiratory distress syndrome; septic shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

                                                                                                                                                                                                                                                                                                                                                                                                             peptides (TRIPs). TRIPS competitively bind to and inhibit the thrombin receptor without afecting thrombins activities toward fibrinogen and other proteins involved in coagulation. They can be used for inhibiting thrombin-induced platelet activation and inhibiting thrombin-induced smooth muscle cell proliferation. They can be used for treating and preventing neurodegenerative disease, treating and preventing bone resorption (eg. in osteoporosis), treating and preventing thrombin-induced inflammation, eg. in adult respiratory distress syndrome, septic shock, septicemia and reperfusion damage) and for inhibiting platelet-dependant thrombosis. Fusion proteins containing these sequences may also act as thrombin
                                                                                                                                                    W41465;

This sequence was used as a part of an aligned peptide array of the invention. The aligned peptide array comprises, as separate elements, peptide segments obtained by dividing the amino acid sequence of a protein into sequence segments of any suitable length and of any suitable preferably with the amino acid sequences of the sequence segments, preferably with the amino acid sequences of the peptide segments expressing the amino acid sequence of the protein. The peptide array can be used in a method for the detection of a binding or interaction site of a protein; in a method for the detection of a ligand for a protein; in a method for the detection of a ligand for a protein; in a method for the detection of a ligand for the design of a protein. Using the information from the above methods, ligands detected by them can be modified, or designed. The peptide array can be used in enzyme immunoassay method, represented by ELIAR. The array can be used in enzyme immunoassay method, represented by ELIAR. The array can

                                                                                                                                                                                                                                                                       The present sequence is an immunomodulatory peptide, which comprises a Class I HLA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in the treatment of autoimmune diseases.

Peptides using the D-form amino acids are more effective immunomodulators than their diastereomers or enantiomers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 1998-018220/02.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               protein search, using sw model

Pharmaceutical compans. contg. these diagnosed Type-I diabetics. Pharmaceutical compans. contg. these specifically reactions of immune system diseases, tumours, and autoimmune diseases, including diabetes. The peptides are able to detect autoimmune diseases, including diabetes. The peptides are able to detect autoimmune diseases, including diabetes. The peptides are able to detect autoimmune diseases, including that are then used for antigen prodn.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GAD; 65 kD; human; glutamic acid decarboxylase; autoreactive; diagnosis; insulin-dependent diabetes mellitus; IDDM; cell-mediated disease; predisposition; autoimmune; tumour; rheumatoid arthritis; multiple sclerosis.
                                                     W18842-70 are peptide fragments of the 65 kD human glutamic acid decarboxylase (GAD). The fragments are autoreactive substances used for disense of insulin-dependent diabetes mellitus (IDDM). The diagnosis is determined by using a claimed method for diagnosis of cell-mediated diseases or a predisposition to cell-mediated diseases, which is effected by administering an autoreactive substance intradermally and establishing the diagnosis on the basis of the occurrence or lack of a positive reaction at the site of administration. The method is used for diagnosis of autoimune and tumour diseases, preferably T-cell-mediated diseases such as rheumatoid arthritis, multiple sclerosis and especially IDDM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic

ALIGNMENTS

Peptide derived from human glutamic acid decarboxylase 1.

05-MAR-1996 R76642;

(first entry)

R76642 standard; peptide; 14 AA

μ.

Pharmaceutical compsus. contg. these peptides and those shown in R86668-72, are useful for the diagnosis of a disease or predispositions of immune system diseases, tumours, and autoimmune diseases, including diabetes. The peptides are able to detect specific T-cell subpopulations that are then used for antigen prodn.,
W18842-70 are peptide fragments of the 65 kD human glutamic acid decarboxylase (GAD). The fragments are autoreactive substances used for decarboxylase (GAD). The fragments are autoreactive substances used for diagnosis of insulin-dependent diabetes mellitus (IDDM). The diagnosis is determined by using a claimed method for diagnosis of cell-mediated diseases or a predisposition to cell-mediated diseases, which is effected by administering an autoreactive substance intradermally and establishing the diagnosis on the basis of the occurrence or lack of a positive reaction at the site of administration. The method is used for diagnosis of autoimume and tumour diseases, preferably T-cell-mediated diseases such as rheumatoid arthritis, multiple sclerosis and especially IDDM.
                                                                                                                                                                                                                                                                                                                                                                         WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         e.g.
